

Progress of Project 13 and further approach for safe navigation in SOMS

12th Project Coordination Committee (PCC) 03 - 04 October 2019 Semarang, Indonesia

Table of Contents

- 1. Aims of the study
- 2. Method and Analysis of the study
- 3. Result of Phase 1 study
- 4. Result of Phase 2 study
- 5. Conclusion

Aims of the study

- To enhance safe navigation in the SOMS by reducing collision risk
- To evaluate the reduction of collision risk if overtaking restriction were introduced in a certain area in Singapore Strait
- To study other possible measures other than overtaking restriction for reducing collision risk in Singapore Strait

Method and Analysis of the Study

Method

output of Simulation Model

Analysis

- 1. Collision Risk Analysis
- 2. Navigational Environmental Stress (ES) Analysis

Input of Non-overtaking restriction

Phase 1 study

Overtaking restriction area

Conclusion of the Phase 1 study

- The overtaking restriction setting has the effect of reducing Collision risk values regardless the length of the restricted areas.
- Setting the overtaking restriction in the eastbound lane on the west side of the Singapore Strait is considered to be effective for improving safety.
- There expressed some concerns at the PCC and TTEG that the maneuvering of high speed ships would be hampered if overtaking restriction were introduced the studied areas overall.
- The 11th PCC and the 43rd TTEG meetings recommended MSC to study further and report the study results at the next PCC and TTEG meetings in 2019.

Phase 2 study

Overtaking restriction area

Passage rule in the East-bound lane under overtaking restricted

	Passage ships	Passage rule in the East-bound lane
Deep-water lane	 Deep draft ship (Ship with draft more than 15 m) Tanker more than VLCC equivalent (Tanker with LOA more than 250 m) 	 Speed less than 12 knots As far as practicable, to avoid overtaking
Shallow- water lane	Ships other than above	 Low speed ships (speed less than 5 knots) and small ships (less than 500 GT) navigate in the right of the lane. When navigating in the right, set as the right 1/3 width of the channel

Simulation Cases

	Traffic volume	Existence of overtaking restriction		
Case. 1	Current	Not set		
Case. 2	Current	Set		
Case. 3	Traffic volume increased for restricted vessels. The following vessels is approximately doubled.	Not set		
Case. 4	ass the Deep-water lane and Deep draft ship (Ships with draft more than 15 m) Tanker more than VLCC equivalent (Tankers with LOA more than 250 m) The other ships are the current traffic volume.	Set		

Current volume

Collision risk (over 10,000GT)	Area 1	Area 2	Area 3	Area 4	Area 5	Area 6
Present	6	162	32	39	22	86
Restriction of Overtaking	0	160	20	29	19	55
Increase / decrease [%]	-100.0%	-1.2%	-37.5%	-25.6%	-13.6%	-36.0%

Double volume

Collision risk (All ship)	Area 1	Area 2	Area 3	Area 4	Area 5	Area 6
Present	40	248	66	44	45	115
Restriction of Overtaking	0	209	34	43	23	85
Increase / decrease [%]	-100.0%	-15.7%	-48.5%	-2.3%	-48.9%	-26.1%

Result of Phase 2 study

- The simulation studies showed that under the limited conditions if overtaking restrictions are provided, the frequency of occurrence of encounter and <u>collision risk decrease in the entire area (Area 1 to Area 6)</u> within the East-bound lane compared with the current situation.
- Within the overtaking restriction section, the <u>occurrence of the</u> <u>overtaking intersection has been eliminated</u> and the <u>occurrence of</u> <u>"Crossing", "Head-on" has also disappeared</u>. Therefore, it is expected that the risk of ships passing through this area could be reduced.
- Also, we also examined the effect of overtaking restrictions in the situation which the large ships ("Deep-draft ships" and "Tankers more than VLCC equivalent") targeted for overtaking restriction increased from the current traffic volume. As a result of comparing the improvement effect of the collision risk according to the traffic volume of the target ship, it was shown that the improvement effect of the collision risk increases as the traffic volume increases in almost the entire area.

Conclusion

- Introducing overtaking restriction needs international concession and further discussion in the international maritime community, not only shipping industry but also the Littoral States.
- The simulation study while useful does not include physical and practical conditions such as tidal changes, crossing situations and varying speeds of vessels. In addition, shipmaster should be given ultimate control and decision of the vessel. Nonetheless, the outcome of the simulation study can be taken into account, where appropriate.
- There are the existing "Rules for Vessels Navigating Through the Straits of Malacca and Singapore" for shipmasters i.e. <u>Rule 2</u> eastbound deep draught vessels navigating in the deep-water routes shall, as far as practicable, avoid overtaking; and <u>Rule 8</u> all vessels to maintain a safe speed consistent with safe navigation, proceed with caution and be in a maximum state of manoeuvring readiness
- To ensure safety of navigation, all vessels should adhere to the "Rules for Vessels Navigating through the SOMS" as well as other international obligations such as COLREGS and take note of the safety advisories issued by VTS authorities when traversing the SOMS.

THANK YOU
